Project-1 of "Advanced Big Data Analytics"

Yanwei Fu

April 5, 2017

Abstract

(1) This is the second project of our course. The project is released on April 5th, 2017. The deadline is 5:00pm, May 7th, 2017. Please send the report to xuelinq@163.com. The late submission is also acceptable; however, you will be penalized 10% of total scores for EVERY ONE DAYS' delay (by 5:00pm of that day). In other words, you won't get any scores for this project if you submit it later than May 17th. 2017.

(2) Note that if you are not satisfied with the initial report, the updated report will also be acceptable given the necessary score penalty of late submission.

(3) OK! That's all. Please let me know if you have any additional doubts of this project. Enjoy!

Note that:

(a) If the size of training instances are too large, you may still want to apply some sampling techniques to extract a small portion of training data.

(b) If you think the dimension of features is too high, you may also want to use some techniques to do feature dimension reduction, such as PCA, KPCA, ISOMAP.

(c) The referring papers are listed as an introduction to the context of problems. It's not necessarily to exactly implement these papers, which actually is not an easy task.

1 Introduction

1.1 Collaboration Policy

You are not allowed to work in a group. This project should be done by your own. You will be graded on the creativity of your solutions, and the clarity with which you are able to explain them. If your solution does not live up to your expectations, then you should explain why and provide some ideas on how to improve it. You are free to use any third-party ideas or code that you wish as long as it is publicly available. You must provide references to any work that is not your own in the write-up. BUT, THE WHOLE ALGORITHMS MUST BE DONE ON SPARK PLATFORM.

1.2 Writing Policy

The final report should be written in English. The main components of the report will cover

1. Introduction to background and potential applications (2%);
2. Algorithms and critical codes in a nutshell (10%);
3. Experimental analysis and discussion of proposed methodology (8%).

Please refer to our latex example: `http://www.sdspeople.fudan.edu.cn/fuyanwei/course/Chap8_Computation_learning/IEEE_TAC_2016.zip`

1.3 Submitting Policy

The paper must be in NIPS format (downloadable from [1]) and it must be double-blind. That is, you are not allowed to write your name on it etc. For more info, please read: NIPS reviewieng and double blind policy.

Package your code and a copy of the write-up pdf document into a zip or tar.gz file called finalProject-*your-student-id1.[zip|tar.gz]. Also include functions and scripts that you had used. To submit the report, email the pdf file to xuelinq@163.com. In the submission email, you should well explain the authours of this project.

1.4 Evaluation of Final Projects

The paper is reviewed as the following NIPS criteria:

Overview: you should briefly summarize the main content of this paper, as well as the Pros and Cons (advantages and disadvantage) in general. This part aims at showing that you had read and at least understand this paper.

Quality: Is the paper technically sound? Are claims well-supported by theoretical analysis or experimental results? Is this a complete piece of work, or merely a position paper? Are the authors careful (and honest) about evaluating both the strengths and weaknesses of the work?

Clarity: Is the paper clearly written? Is it well-organized? (If not, feel free to make suggestions to improve the manuscript.) Does it adequately inform the reader? (A superbly written paper provides enough information for the expert reader to reproduce its results.)

Originality: Are the problems or approaches new? Is this a novel combination of familiar techniques? Is it clear how this work differs from previous contributions? Is related work adequately referenced?

Significance: Are the results important? Are other people (practitioners or researchers) likely to use these ideas or build on them? Does the paper address a difficult problem in a better way than previous research? Does it advance the state of the art in a demonstrable way? Does it provide unique data, unique conclusions on existing data, or a unique theoretical or pragmatic approach?

1.4.1 Requirements

For all the projects listed below, in general you can devise your own machine learning algorithms or use the existing algorithms which target at each specific problem of each project. You should compare with *linear regression/classification, K-NN/NN, logistic regression, linear/RBF kernel SVM, Neural network* as well as *tree-based methods*. Thus you can just apply and compare with these methods; and explain the advantage and disadvantage of using these methods for the project problem. Note that, your algorithms can be derived from one of these machine learning algorithms; and feel free to use any other machine learning package you like. BUT, THE WHOLE ALGORITHMS MUST BE DONE ON SPARK PLATFORM.

2 Question 1: Detect the location of keypoints on face images

2.1 Introduction to this project

This project comes from Kaggle: `https://www.kaggle.com/c/facial-keypoints-detection`.

[1] https://nips.cc/Conferences/2016/PaperInformation/StyleFiles

The objective of this task is to predict keypoint positions on face images. This can be used as a building block in several applications, such as: tracking faces in images and video analysing facial expressions detecting dysmorphic facial signs for medical diagnosis biometrics / face recognition Detecing facial keypoints is a very challenging problem. Facial features vary greatly from one individual to another, and even for a single individual, there is a large amount of variation due to 3D pose, size, position, viewing angle, and illumination conditions. Computer vision research has come a long way in addressing these difficulties, but there remain many opportunities for improvement.

This getting-started competition provides a benchmark data set and an R tutorial to get you going on analysing face images. For more details, please refer to that website.

2.2 Data File

Each predicted keypoint is specified by an (x,y) real-valued pair in the space of pixel indices. There are 15 keypoints, which represent the following elements of the face:

left_ eye_ center, right_ eye_ center, left_ eye_ inner_ corner, left_ eye_ outer_ corner, right_ eye_ inner_ corner, right_ eye_ outer_ corner, left_ eyebrow_ inner_ end,

left_ eyebrow_ outer_ end, right_ eyebrow_ inner_ end, right_ eyebrow_ outer_ end, nose_ tip,

mouth_ left_ corner, mouth_ right_ corner, mouth_ center_ top_ lip, mouth_ center_ bottom_ lip

Left and right here refers to the point of view of the subject.

In some examples, some of the target keypoint positions are misssing (encoded as missing entries in the csv, i.e., with nothing between two commas).

The input image is given in the last field of the data files, and consists of a list of pixels (ordered by row), as integers in (0,255). The images are 96x96 pixels.

Data files can be downloaded from the project websites or Kaggle websites:

training.csv: list of training 7049 images. Each row contains the (x,y) coordinates for 15 keypoints, and image data as row-ordered list of pixels.

test.csv: list of 1783 test images. Each row contains ImageId and image data as row-ordered list of pixels

submission FileFormat.csv: list of 27124 keypoints to predict. Each row contains a RowId, ImageId, FeatureName, Location. FeatureName are "left_eye_center_x," "right_eyebrow_outer_end_y," etc. Location is what you need to predict.

2.3 Submission and Evaluation

For the paper writing purposes, you may split the training set into 90% and 10% respectively. Since we donot have the ground-truth for test.csv, the 10% held-out data can be served as the testing data to evaluate your own algorithms. You may also want to make a submission to Kaggle website for this dataset.

3 Question 2: Large-scale video classification

Our group has one big dataset for video understanding. The dataset can be downloaded from `http://bigvid.fudan.edu.cn/data/fcvid/`. Note that low-level features have been extracted and provided in the link.

The whole dataset is well described in `http://bigvid.fudan.edu.cn/FCVID/`. For this dataset, please read

> [1] Exploiting Feature and Class Relationships in Video Categorization with Regularized Deep Neural Networks, Yu-Gang Jiang, Zuxuan Wu, Jun Wang, Xiangyang Xue, Shih-Fu Chang. 2015

3.1 Requirements

For this task, one can only finish the task of supervised learning for all 239 classes. The requirements include:

1. randomly sampling the training instances of each video classes from few training instances to large number of training instances;
2. comparing different types of features; and discuss the differences and complementarity of each type of features.
3. exploring the relationships of all classes as Sec.4.2.2 in [1].
